

## Differentiability and inverses

Ex1. Differentiate  $(x^2+7)^{13}$ .

$$((x^2+7)^{13})' = 13(x^2+7)^{12} \cdot 2x$$

Ex2. Compute derivatives.

1.  $f_1(x) = (x^2+1) \sin(x)$

$$f_1'(x) = 2x \sin(x) + (x^2+1) \cos(x)$$

2.  $f_2(x) = \frac{e^x}{x^2}$

$$f_2'(x) = \frac{e^x x^2 - e^x \cdot 2x}{x^4} = \frac{x^2 - 2x}{x^4} e^x = \frac{x-2}{x^3} e^x$$

3.  $f_3(x) = \cos(\ln(x)+1)$

$$f_3'(x) = -\sin(\ln(x)+1) \cdot \frac{1}{x}$$

4.  $f_4(x) = \cos(\cos(\cos(x)))$

$$\begin{aligned} f_4'(x) &= -\sin(\cos(\cos(x))) \cdot (-\sin(\cos(x))) \cdot (-\sin(x)) \\ &= -\sin(\cos(\cos(x))) \cdot \sin(\cos(x)) \cdot \sin(x) \end{aligned}$$

Ex3. Compute derivatives.

1.  $f_1(t) = t^2 + i \sin(t)$

$$f_1'(t) = 2t + i \cos(t)$$

2.  $f_2(t) = 1 + i t^5$

$$f_2'(t) = 5i t^4$$

$$3. f_3(t) = t^5 - i$$

$$f_3'(t) = 5t^4$$

$$4. f_4(t) = 3e^{it}$$

$$f_4'(t) = 3ie^{it}$$

$$5. f_5(t) = ie^{2t+3it}$$

$$f_5'(t) = i(2+3i)e^{2t+3it} = (-3+2i)e^{2t+3it}$$

Ex 4. Determine the derivative of  $\arcsin$  using  $(f^{-1})'(y) = \frac{1}{f'(x)}$ .

$$\begin{aligned} (\arcsin^{-1})'(y) &= \frac{1}{(\sin(x))'} = \frac{1}{\cos(x)} \\ &= \frac{1}{\sqrt{1-\sin^2(x)}} = \frac{1}{\sqrt{1-y^2}} \end{aligned}$$

Recall that sine is the function relating values  $y$  to input  $x$  by  $y = \sin(x)$ , hence the last substitution. So we have  $(\arcsin^{-1})'(x) = \frac{1}{\sqrt{1-x^2}}, x \in ]-1,1[$ .

Ex 5.

a) Show that  $\tan'(t) = 1 + \tan^2(t)$  where defined.

$$\tan'(t) = \left( \frac{\sin(t)}{\cos(t)} \right)' = \frac{\cos(t) \cdot \cos(t) - \sin(t) \cdot (-\sin(t))}{\cos^2(t)}$$

$$= \frac{\cos^2(t) + \sin^2(t)}{\cos^2(t)} = 1 + \tan^2(t) \quad \left( \text{also } \frac{1}{\cos^2(t)} \right)$$

$\cos(t) \neq 0$ .

b) Determine  $\arctan'(x)$ .

$$\begin{aligned}\arctan'(y) &= \frac{1}{\tan'(x)} = \frac{1}{1 + \tan^2(x)} \quad , \quad y = \tan(x) \\ &= \frac{1}{1 + y^2} \quad , \quad y \in \mathbb{R}.\end{aligned}$$

Thus we have  $\arctan'(x) = \frac{1}{1+x^2}$  for  $x \in \mathbb{R}$ .

Exb. Show by definition that  $f(x) = x^2$  is differentiable for every  $x_0 \in \mathbb{R}$  with  $f'(x_0) = 2x_0$ .

Using  $f(x) = f(x_0) + a(x-x_0) + \varepsilon(x-x_0)(x-x_0)$   
we have for arbitrary  $x_0 \in \mathbb{R}$

$$x^2 = x_0^2 + a(x-x_0) + \varepsilon(x-x_0)(x-x_0)$$

$$\Leftrightarrow x^2 - x_0^2 = a(x-x_0) + \varepsilon(x-x_0)(x-x_0)$$

$$\Leftrightarrow (x+x_0)(x-x_0) = a(x-x_0) + \varepsilon(x-x_0)(x-x_0)$$

$$\Leftrightarrow x+x_0 = a + \varepsilon(x-x_0)$$

$$\rightarrow 2x_0 - a = \varepsilon(0) \quad \text{for } x \rightarrow x_0.$$

With  $a = 2x_0$  we have  $\varepsilon(0) = 0$  and  $|\varepsilon(x-x_0)| \rightarrow 0$   
for  $x \rightarrow x_0$ . Thus differentiability is ascertained by  
definition 1.59.

Ex 7.

a) Solve quadratics in  $\mathbb{R}$  and  $\mathbb{C}$ .

1.  $2x^2 + 9x - 5 = 0$        $D = 9^2 - 4 \cdot 2 \cdot (-5) = 121$

$$x = \frac{-9 \pm 11}{4} = \begin{cases} \frac{1}{2} \\ -5 \end{cases} \quad \text{in } \mathbb{R} \text{ and } \mathbb{C}$$

2.  $x^2 - 4x = 0 \Leftrightarrow 2(x-4) = 0 \Leftrightarrow x=0 \vee x=4$  in  $\mathbb{R}$  and  $\mathbb{C}$ .

3.  $x^2 - 4x + 13 = 0$        $D = (-4)^2 - 4 \cdot 13 = -36$

No real solutions. In  $\mathbb{C}$  we have

$$x = \frac{4 \pm 6i}{2} = 2 \pm 3i.$$

b) Solve  $2(x+1-i)(x+1+i) = 0$  and show it's actually real coefficients.

We have

$$2(x - (-1+i))(x - (-1-i)) = 0$$

$$\Leftrightarrow x = -1+i \vee x = -1-i.$$

By multiplying out we find the coefficients.

$$\begin{aligned} 2(x+1-i)(x+1+i) &= 2(x^2 + x + ix + x + 1 + i - ix - i + 1) \\ &= 2x^2 + 4x + 4. \end{aligned}$$

Ex 8.

a) Solve  $z^2 - (1+5i)z = 0 \Leftrightarrow z(z - (1+5i)) = 0$

$$\Leftrightarrow z = 0 \vee z = 1+5i$$

b) Solve  $z^2 + (2+2i)z - 2i = 0$ .

$$D = (2+2i)^2 - 4 \cdot (-2i) = 4 - 4 + 8i + 8i = 16i.$$

We have  $\omega^2 = 16i$  and one solution  $\omega_0$  is  $4e^{\frac{\pi}{4}i} = \sqrt{8} + i\sqrt{8}$ ,  
the other is  $-\sqrt{8} - i\sqrt{8}$ .

$$z_0 = \frac{-2-2i + \sqrt{8} + i\sqrt{8}}{2} = \frac{-2+\sqrt{8}}{2} + \frac{-2+\sqrt{8}}{2} i = -1 + \sqrt{2} + (\sqrt{2}-1)i$$

$$z_1 = \frac{-2-2i - \sqrt{8} - i\sqrt{8}}{2} = \frac{-2-\sqrt{8}}{2} + \frac{-2-\sqrt{8}}{2} i = -1 - \sqrt{2} - (\sqrt{2}+1)i$$

Ex 9.

a) Show that  $f_1(x) = \begin{cases} \frac{x}{|x|}, & x \neq 0 \\ 0, & x = 0 \end{cases}$  is not an  $\varepsilon$ -function.

$$|f_1(x)| \rightarrow \pm \infty \neq 0 \text{ for } x \rightarrow 0^+ \text{ and } x \rightarrow 0^- \text{ respectively.}$$

b) Show that  $f_2(x) = 1 - \cos(x)$  is an  $\varepsilon$ -function.

$$f_2(0) = 1 - \cos(0) = 1 - 1 = 0 \text{ and}$$

$$|f_2(x)| = |1 - \cos(x)| \rightarrow |1 - 1| = 0 \text{ for } x \rightarrow 0.$$

c) Show that  $f_3(x) = ie^{ix} - i$  is an  $\varepsilon$ -function.

$$f_3(0) = ie^{i \cdot 0} - i = i \cdot 1 - i = 0 \text{ and}$$

$$\begin{aligned} |f_3(x)| &= |ie^{ix} - i| = |i(e^{ix} - 1)| = |i| |e^{ix} - 1| \\ &= |e^{ix} - 1| \rightarrow |e^{i \cdot 0} - 1| = 0 \text{ for } x \rightarrow 0. \end{aligned}$$
